

#countonconeart

"After researching kilns, I decided to adopt a Cone Art kiln because of its thicker walls, floor element, three thermocouples, and Genesis controller. No more worrying about the kiln overnight, now I can just select the firing program I need and press 'start' and get a full night's sleep. If I need to check how the temperatures are, I can just look at my phone.

I named my kiln Bernice - she's like the most responsible employee one could have. In her 5 years with us, not one under or over firing...or any other issues. She's surpassed any and all of my expectations.

When my husband, John, started creating fused glass art, we were sceptical about whether it would work in Bernice. But she heats up every zone consistently to temperature and his results are perfect every time.

We love our Cone Art kiln so much...that we've decided to adopt a little sibling for Bernice. A GX2318D kiln will soon become a part of our team. Choosing another Cone Art was the easy part...now to figure a name for it."
